Project Report: Manual SQA & Security Audit

Target: Automation Exercise (E-commerce)

Tester: Farooque Sajjad

Date: March 17, 2026

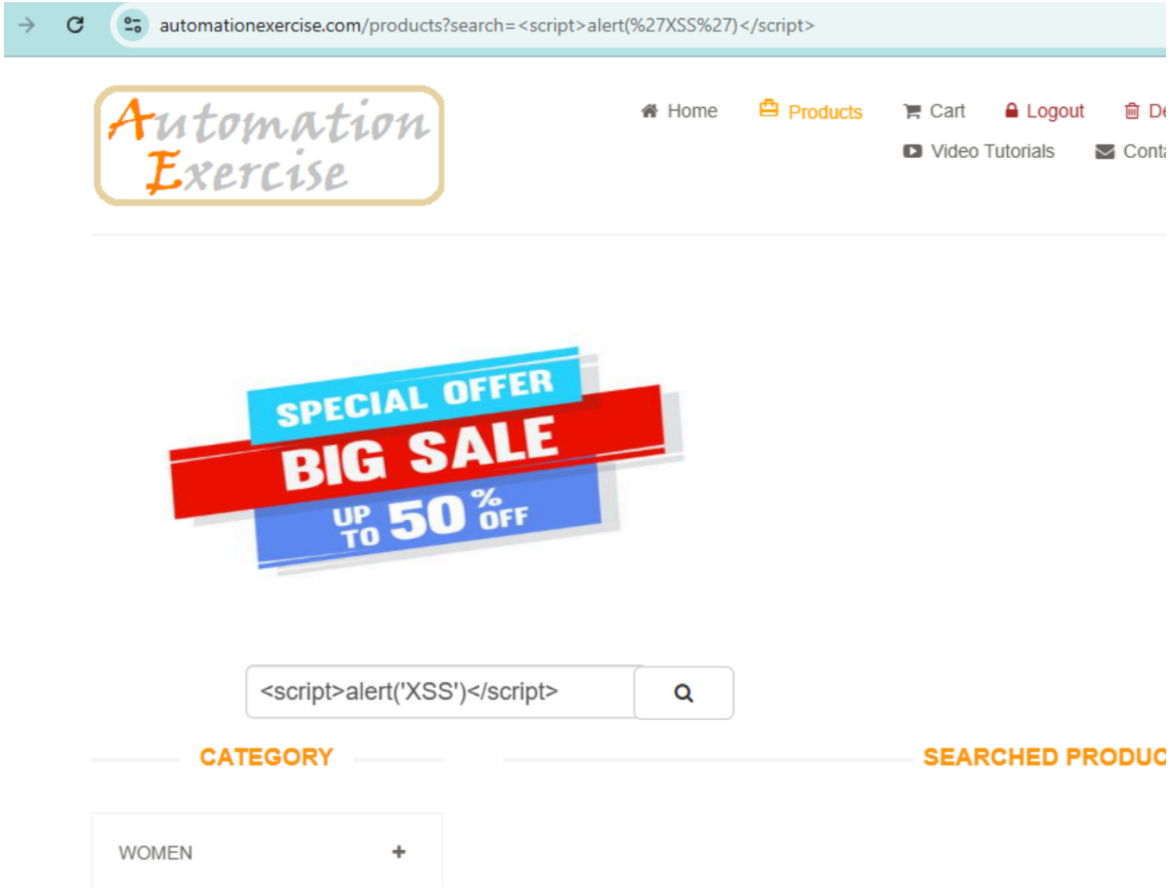
---

1. Executive Summary

This report documents the manual testing results for the Automation Exercise platform. The audit focused on the User Authentication, Search, and Checkout flows, with a specific emphasis on **Input Sanitization** and **Logical Transitions**.

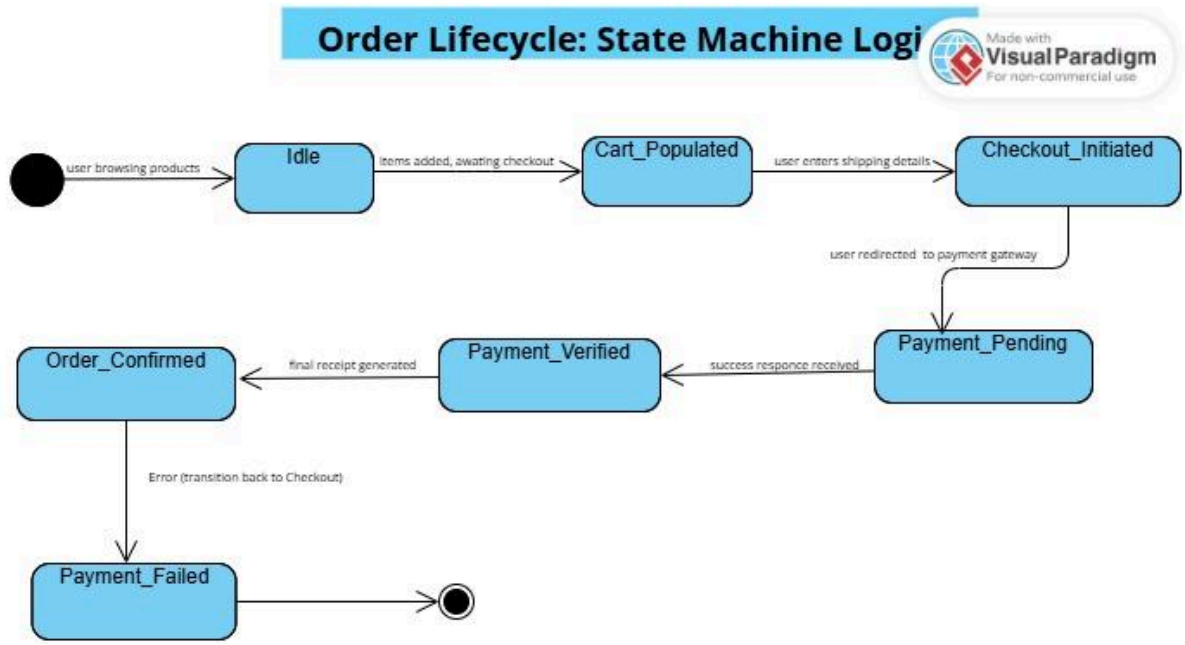
2. Security Testing: XSS Validation

- **Test Objective:** To verify if the search field is vulnerable to Cross-Site Scripting (XSS) attacks.
- **Input String:** `<script>alert('XSS')</script>`
- **Result: PASSED**. The system correctly sanitized the input and rendered it as a literal string rather than executing the script.



3. Logical Modeling: State Machine Analysis

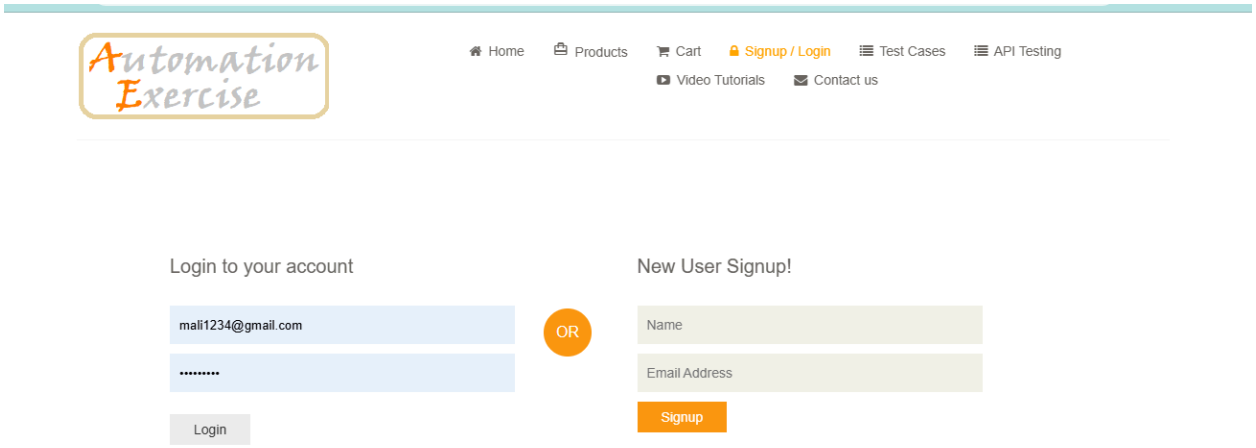
To ensure the integrity of the "Order Lifecycle," a State Machine Diagram was developed. This was used to identify potential "Illegal States" during the checkout process.

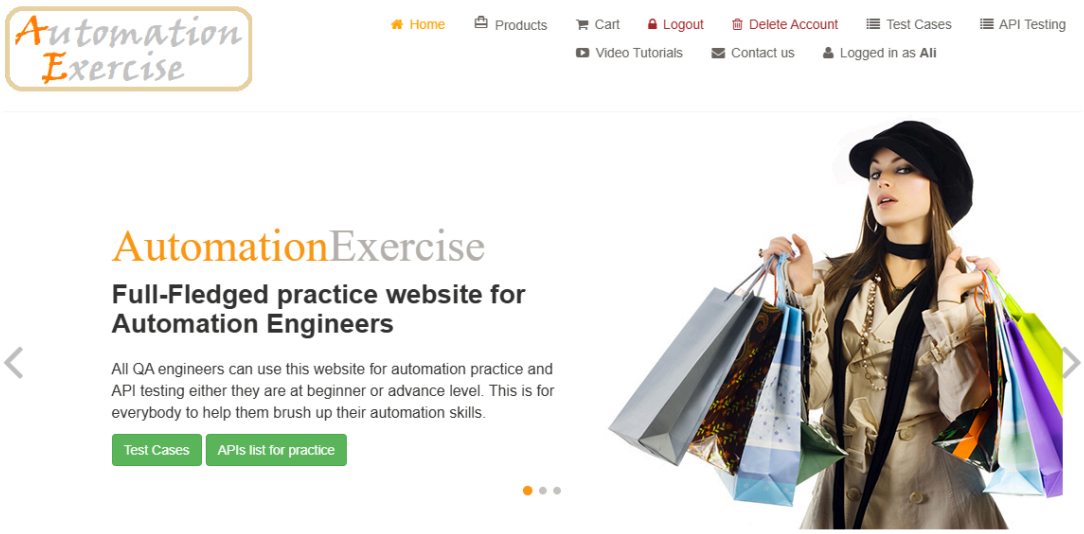


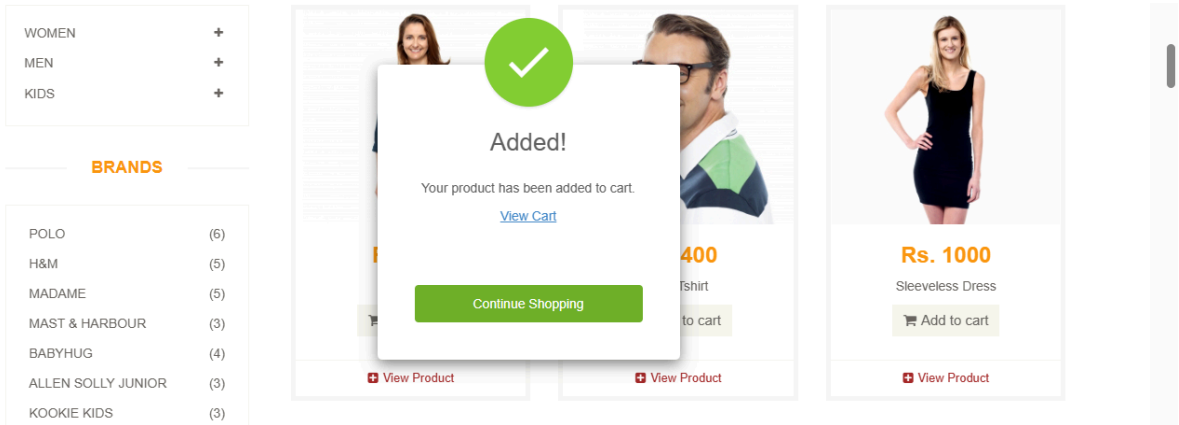
---

4. Functional Testing (Selected Scenarios)

- **Scenario:** Validate "Add to Cart", User Login and total amount.
- **Result:** All core functional flows met the requirement criteria.







---

5. Bug Report (Defect Log)

Based on the manual audit, the following issues were identified:

Bug ID	Description	Severity	Status

BUG-001	XSS Script reflected in URL but not executed	Low	Closed (Pass)
